Does The Weather Affect Our Mood? - Audioscript 2

Do grey days bring grey moods? When the temperature rises, does our blood **boil**?
It is a common thought around the world that sunny, warm weather is linked to happiness and cold, cloudy weather is linked to sadness.
Sunshine is tied to mood. **Sunlight** has been found to **boost** positive moods and **dampen** negative moods and **diminish tiredness**. On **gloomy wet** days, our mood changes, and we get depressed.
When something **alters** our mood, it can affect our behaviour. Happy people are more **inclined** to one another, and people are more helpful when the sun is out.

Just think. **Diners**, or restaurant customers, are more **willing** to **tip** more generously on sunny days, and if **romance** is in the air, it increases with the temperature.
However, warm weather has been found to bring out the worst in people. The higher the temperature, the more likely people are to **act aggressively**, so the warmer, the more aggressive.

Indeed, a **pattern** can be observed. When there is intense hot weather, and especially in traffic, drivers honk the car horns much more than in other types of weather. Humidity tends to make people more tired. People feel lower satisfaction with their lives on rainy days.
So, why do people feel happier when there is sunlight? Well, there is an explanation. When we expose our skin to sunlight, this produces vitamin D, which promotes the brain to produce serotonin, which makes us feel happier! But this happens only if people go outdoors, in the sunlight, for at least 30 minutes per day.
The bottom line is that **whatever** the weather, it can affect our mood.
