Running Out Of Time – Audioscript 2

According to the World Meteorological Organisation (WMO), there has been an enormous amount of carbon dioxide that entered the atmosphere in 2013. The problem is related to the Earth's temperature, it is predicted it will increase by two to five degrees Celsius in 60-70 years' time. Furthermore, the Earth's ecosystems – the oceans and the forests – are no longer able to absorb all these greenhouse gases. The oceans are becoming more acidic, and this is happening fast.

Some people are not worried about these changes because they doubt that the reports are right, they sort of don't believe in the reports. Others instead say that there is too much consumerism. Some say that we can't carry on eating steaks every day, and driving big cars, and flying to distant places for our holidays and expect the problem to go away without changing our lifestyles. It's up to each of us to change our lifestyle.

All the people in the world should reduce the amount of CO2 – carbon dioxide – but there are parts of the world where people are burning more coal and gas. It is impossible to avoid environmental disasters.

The governments want their citizens to be rich: can we blame them? The only real answer is to find a technological solution to these problems, I mean, cleaner fuels, more recycled goods, new ways of making electricity, etc. Big industries have created these problems, so they can find a solution. But business will only do something when it affects their bottom line – in other words, when change is demanded by their customers. Companies won't stop manufacturing something harmful to the environment, for example producing plastic stuff, unless we stop buying them.
